

METHODS FOR SIGNALING BROADCAST AND MULTICAST INFORMATION IN COMMUNICATION NETWORKS

ABSTRACT OF THE DISCLOSURE

Methods for signaling information to a group of users in a communication network supporting a broadcast-multicast service are described, in which one or more indicator bits of a sequence may be assigned to indicate transmission of signaling information that is related to the group. The sequence may be transmitted to the group on a first channel, with the signaling information related to the group being transmitted on a second channel.
